September 2026

2027 Summer Intern, Software Developer

ICF

First, I would like to talk about how I approach problems, how I get better at them, and how I work in a team. I accept it when I fall short of understanding something, and I give my best to understand it from people better than me. I have a lot of respect for anyone I can learn from, and I am not ashamed to ask the same question twice if that is what it takes. It works the other way too. When someone is stuck on something I have already worked out, I will sit with them rather than hand over the answer, and I come out of those understanding it better than when I went in. Knowledge seems to be one of the few things that grows when you share it. I think about problems in systems, and I approach them that way. I also ask the questions that are uncomfortable - I have seen them frustrate people, but they are usually the ones that need asking. I know I have a lot left to learn.

I would encourage you to visit my portfolio at www.asmit.space.

I am a first-year M.S. Computer Science student at NYU, after a B.S. at Arizona State and three engineering internships. At MyYogaTeacher I was given the initial design of a new feature and turned the idea into diagrams, wireframes and user journeys for the development team, then built against my own drawings. The voice-to-SQL pipeline I shipped on Whisper replaced the admin team's Ctrl+F-and-edit workflow and gave them back the hours that took. At WatchDNA I set up the backend from scratch on Node.js - the schema, the REST endpoints, JWT authentication with role-based access, the security middleware - and built the store locator and the admin console over it. An automated Python pipeline discovers the retailer endpoints. Those replaced an expensive third-party app the company had been paying for, and within six months of going live the traffic was up.

Outside work I am always building something, usually to try a technology I have not used yet, and the two most recent are agent systems. Lead Engine keeps five scout agents running in parallel across Zillow, Redfin, FSBO, expired listings and the Maricopa County Assessor, deduplicates what they find by address, and scores every lead with the reasoning written out beside the score - 2,129 leads sourced. Torii is a proxy between an AI agent and every paid tool it calls, with a budget reserved before each call, a JSON policy the human edits without touching code, and a ledger of every call and every reason one was blocked. Most of my own work now runs through coding agents, and the part I have got good at is the harness around them rather than the prompt. I have not used Salesforce, ServiceNow or Appian. Torii's policy file is the same idea at a much smaller scale, and I would expect to pick the platforms up the way I picked up everything else on this page. Your Fathom agents are built to sit inside an agency's existing systems rather than beside them. That is the part of agentic work I would most like to learn from the inside: the integration, the permissions, and what happens when an agent is wrong.

I am in New York and available full time from June 2027.
