AI / ML Engineering Intern - GenAI

Bain

First, I would like to talk about how I approach problems, how I get better at them, and how I work in a team. I accept it when I fall short of understanding something, and I give my best to understand it from people better than me. I have a lot of respect for anyone I can learn from, and I am not ashamed to ask the same question twice if that is what it takes. It works the other way too. When someone is stuck on something I have already worked out, I will sit with them rather than hand over the answer, and I come out of those understanding it better than when I went in. Knowledge seems to be one of the few things that grows when you share it. I think about problems in systems, and I approach them that way. I also ask the questions that are uncomfortable - I have seen them frustrate people, but they are usually the ones that need asking. I know I have a lot left to learn.

I would encourage you to visit my portfolio at www.asmit.space.

The guardrails and human-in-the-loop line in your posting is the problem I have spent this year on. Torii is an MCP proxy I designed and built that sits between AI agents and the paid tools they call: a JSON policy engine with per-session budgets, tool allowlists and rate limits, a tracker that reserves funds before the upstream call so two agents cannot overspend at once, and a SQLite ledger recording every call and every reason one was blocked, surfaced on a live dashboard. A human owns the policy and the agent owns execution. It handles the x402 payment flow end to end, and it is about seven hundred lines of TypeScript on two production dependencies.

Alongside that, the GenAI work I have shipped inside a company was at MyYogaTeacher, where I built a voice-to-SQL pipeline on Whisper with streaming LLM responses that replaced the admin team's manual workflow. Lead Engine is a FastAPI and React system where autonomous agents scout public records and score every lead against a written framework, with the reasoning recorded next to the score, because a score you cannot interrogate is not a score. My research before that was classical rather than generative - Gaussian Process classifiers for high-dimensional data, under Prof. R. P. Singh at the University of Delhi.

On the last thing you ask for: I spent a year as Technical Officer of the AI Society at Arizona State, writing the teaching materials and running the workshops that introduced machine learning to students with no technical background. Explaining a system to someone who does not have it yet is a skill I have practised deliberately, and it is the part of client-facing work I am most confident about.

I am a first-year M.S. Computer Science student at NYU, graduating in 2028 and available from June 2027.
