September 2026

Software Engineering Intern, Summer 2027

Dropbox

First, I would like to talk about how I approach problems, how I get better at them, and how I work in a team. I accept it when I fall short of understanding something, and I give my best to understand it from people better than me. I have a lot of respect for anyone I can learn from, and I am not ashamed to ask the same question twice if that is what it takes. It works the other way too. When someone is stuck on something I have already worked out, I will sit with them rather than hand over the answer, and I come out of those understanding it better than when I went in. Knowledge seems to be one of the few things that grows when you share it. I think about problems in systems, and I approach them that way. I also ask the questions that are uncomfortable - I have seen them frustrate people, but they are usually the ones that need asking. I know I have a lot left to learn.

I would encourage you to visit my portfolio at www.asmit.space.

I am a first-year M.S. Computer Science student at NYU, graduating in 2028, after a B.S. at Arizona State and three engineering internships. At WatchDNA I set up the backend from scratch on Node.js - the schema, the REST endpoints, JWT authentication with role-based access, the security middleware - and built the store locator and the admin console over it. Those replaced an expensive third-party app the company had been paying for, and within six months of going live the traffic was up. The companion React Native app I shipped reused the same auth and data layers. At MyYogaTeacher I wrote the React Native client that streams biometric data in real time, with offline-first sync and time-series deduplication so nothing is lost when the network drops. The voice-to-SQL pipeline I shipped on Whisper replaced the admin team's Ctrl+F-and-edit workflow and gave them back the hours that took.

Outside work I am always building something, usually to try a technology I have not used yet. The two most recent are Lead Engine and Torii. Most of my own work now runs through coding agents, and the part I have got good at is the harness around them rather than the prompt. Lead Engine keeps five scout agents running in parallel across Zillow, Redfin, FSBO, expired listings and the Maricopa County Assessor, and deduplicates what they find by address. Every lead is scored with the reasoning written out beside the score, so a bad call is visible instead of buried - 2,129 leads sourced. Torii is the other half: a proxy between an agent and every paid tool it calls. A budget is reserved before each call so two agents cannot overspend at once, and a ledger keeps every call and every reason one was blocked. The human controls policy. The agent controls execution. Between them, that is how I spend tokens: in parallel where the work splits, with a budget on every agent, and with checks that catch what the model gets wrong. Your engineering blog's post on what happens after code generation - the bottleneck moving to review, CI and validation - is the same thing seen from inside a much larger company. It is the problem I would most like to work on.

I am in New York and available full time for any of the three start dates.
