September 2026

Software Engineering Intern, Full-Stack Product

Microsoft

First, I would like to talk about how I approach problems, how I get better at them, and how I work in a team. I accept it when I fall short of understanding something, and I give my best to understand it from people better than me. I have a lot of respect for anyone I can learn from, and I am not ashamed to ask the same question twice if that is what it takes. It works the other way too. When someone is stuck on something I have already worked out, I will sit with them rather than hand over the answer, and I come out of those understanding it better than when I went in. Knowledge seems to be one of the few things that grows when you share it. I think about problems in systems, and I approach them that way. I also ask the questions that are uncomfortable - I have seen them frustrate people, but they are usually the ones that need asking. I know I have a lot left to learn.

I would encourage you to visit my portfolio at www.asmit.space.

I am a first-year M.S. Computer Science student at NYU, graduating in 2028, after a B.S. at Arizona State and three engineering internships. WatchDNA was the whole stack. I built the store locator, an interactive Mapbox map with real-time filtering, and the admin console behind it. I set up the backend from scratch on Node.js - the schema, the REST endpoints, JWT authentication with role-based access, the security middleware. When the companion app came, I built it in React Native on the same auth and data layers and took it through iOS App Store review. Those tools replaced an expensive third-party app the company had been paying for, and within six months of going live the traffic was up. At MyYogaTeacher I was given the initial design of a new feature, turned the idea into diagrams, wireframes and user journeys for the development team, and then built against my own drawings. I wrote the React Native client that streams biometric data in real time, with offline-first sync and time-series deduplication so nothing is lost when the network drops. The voice-to-SQL pipeline I shipped on Whisper replaced the admin team's Ctrl+F-and-edit workflow and gave them back the hours that took. Before that, at Flickmatch, I revamped the website end to end, turning new Figma designs into responsive React and Material-UI components across every page.

Outside work I am always building something, usually to try a technology I have not used yet. Lead Engine is the most recent: a FastAPI backend with a React dashboard over it. Five scout agents run in parallel across Zillow, Redfin, FSBO, expired listings and the Maricopa County Assessor, and every lead is scored with the reasoning written out beside the score - 2,129 leads sourced. The dashboard is a live pipeline graph, so a failed scout shows up the moment it fails, and on everything I have shipped I hook up alerts for when something goes wrong, so it gets debugged and fixed right away. Torii is a proxy between an AI agent and every paid tool it calls, with a budget reserved before each call and a ledger of every call and every reason one was blocked. Most of my own work now runs through coding agents, and the part I have got good at is the harness around them rather than the prompt.

I am in New York and available full time from June 2027.
