September 2026

Summer 2027 Software Internship - Boltline

Stoke Space, Kent, Washington

First, I would like to talk about how I approach problems, how I get better at them, and how I work in a team. I accept it when I fall short of understanding something, and I give my best to understand it from people better than me. I have a lot of respect for anyone I can learn from, and I am not ashamed to ask the same question twice if that is what it takes. It works the other way too. When someone is stuck on something I have already worked out, I will sit with them rather than hand over the answer, and I come out of those understanding it better than when I went in. Knowledge seems to be one of the few things that grows when you share it. I think about problems in systems, and I approach them that way. I also ask the questions that are uncomfortable - I have seen them frustrate people, but they are usually the ones that need asking. I know I have a lot left to learn.

I would encourage you to visit my portfolio at www.asmit.space.

Boltline is software for the people running an operation rather than for end customers, and that is the kind I have built most. At WatchDNA I wrote the admin console the team used for data operations, the store locator it fed, and the Python pipeline that kept the retailer data current on its own - on a backend I had built from scratch in TypeScript and Node, with PostgreSQL behind it and JWT authentication with role-based access in front. I stayed on it for nine months, which is long enough to maintain something rather than just ship it. Before that I revamped Flickmatch's website end to end in React, and wrote its state management as modular pieces so the same logic carried across the site as it grew.

On taking a complex project through execution: Torii is an MCP proxy I designed and built alone, sitting between AI agents and the paid tools they call, with a JSON policy engine, a budget tracker that reserves funds before the upstream call, and a SQLite ledger recording every blocked call and why. About seven hundred lines of TypeScript on two production dependencies. Lead Engine is the same shape at a larger scale - a FastAPI backend and a React dashboard over a pipeline that scouts public records, deduplicates by address and scores what it finds. Both started as a question I could not answer and ended as something running.

I am available onsite in Kent for the full term from May 2027.
