September 2026

Software Engineering Intern, Systems Engineering

Waymo

First, I would like to talk about how I approach problems, how I get better at them, and how I work in a team. I accept it when I fall short of understanding something, and I give my best to understand it from people better than me. I have a lot of respect for anyone I can learn from, and I am not ashamed to ask the same question twice if that is what it takes. It works the other way too. When someone is stuck on something I have already worked out, I will sit with them rather than hand over the answer, and I come out of those understanding it better than when I went in. Knowledge seems to be one of the few things that grows when you share it. I think about problems in systems, and I approach them that way. I also ask the questions that are uncomfortable - I have seen them frustrate people, but they are usually the ones that need asking. I know I have a lot left to learn.

I would encourage you to visit my portfolio at www.asmit.space.

Part of why I am writing is that I have built a very small piece of this problem. Lynti is a transportation app I built in React Native to digitize ride booking. Set beside a driver with ten million rider-only trips behind it that is not much, and I know it. But it is the same problem from the passenger's end, and building it is what made me interested in the half I could not build.

The work in this posting is test infrastructure, and the closest thing I have built is Pash: uploads land in S3, jobs queue through SQS, and the separation runs on a remote CUDA worker - a job runner, with execution moved off the machine that asked for it. At WatchDNA I wrote a Python pipeline that finds retailer endpoints on its own. And your fourth bullet, authoring design documents and running workshops to onboard engineers, is the one I have done most directly: as Technical Officer of the AI Society at Arizona State I wrote the teaching materials and ran the workshops that made machine learning approachable to students with no technical background.

I am available from June 2027.
