September 2026

Software Engineering Intern, Systems Engineering

Fault Protection & Remote Assistance V&V, Waymo

First, I would like to talk about how I approach problems, how I get better at them, and how I work in a team. I accept it when I fall short of understanding something, and I give my best to understand it from people better than me. I have a lot of respect for anyone I can learn from, and I am not ashamed to ask the same question twice if that is what it takes. It works the other way too. When someone is stuck on something I have already worked out, I will sit with them rather than hand over the answer, and I come out of those understanding it better than when I went in. Knowledge seems to be one of the few things that grows when you share it. I think about problems in systems, and I approach them that way. I also ask the questions that are uncomfortable - I have seen them frustrate people, but they are usually the ones that need asking. I know I have a lot left to learn.

I would encourage you to visit my portfolio at www.asmit.space.

Part of why I am writing is that I have built a very small piece of this problem. Lynti is a transportation app I built in React Native to digitize ride booking. Set beside a driver with ten million rider-only trips behind it that is not much, and I know it. But it is the same problem from the passenger's end, and building it is what made me interested in the half I could not build.

The pipelines and the dashboards I have done. Lead Engine is a Python and SQL system that runs five scout agents constantly, deduplicates what they find by address and scores each lead with the reasoning written out - and the part I would point at for this role is the dashboard over it, a live pipeline graph where every scout, score and call is visible while it runs and a failed scout shows up the moment it fails - because a pipeline I could not watch fail was one I could not fix. At MyYogaTeacher I shipped a voice-to-SQL pipeline that replaced the admin team's Ctrl+F-and-edit workflow, and at WatchDNA a Python pipeline that finds retailer endpoints on its own.

I am available from June 2027.
